

HYBRID POWER

The Solar Wind hybrid Power Generation system is the combination of Micro Windmill and Solar Photo Voltaic technologies offers several advantages over either single system. In most of the areas of India, wind speeds are low in the winter season when the sun shines bright, and the wind is strong in the rainy season when less sunlight is available.

And in summer season both wind as well as sun light is brighter, we can harvest best of wind and solar energy. Because the peak operating times for wind and solar systems occur at different times of the day and year, hybrid systems are more likely to produce power when you need it.
